Medical Misdiagnosis:
Challenging the Malpractice Claims of the Doctors' Lobby

Public Citizen
Congress Watch
January 2003
Acknowledgments
This report was written by Public Citizen’s Congress Watch Legislative Counsel Jackson Williams, based on extensive research provided by Civil Justice Fellow Gretchen Denk, Legislative Assistant Rebecca Romo, Special Counsel Barry Boughton, and Senior Researcher Andrew Benore. Congress Watch Director Frank Clemente provided significant editorial direction. State supplementary reports were written by Research Director Neal Pattison and Civil Justice Fellow Gretchen Denk.

About Public Citizen
Public Citizen is a 150,000 member non-profit organization based in Washington, D.C. representing consumer interests through lobbying, litigation, research and public education. Since its founding by Ralph Nader in 1971, Public Citizen has fought for consumer rights in the marketplace, safe and affordable health care, campaign finance reform, fair trade, clean and safe energy sources, and corporate and government accountability. Public Citizen has five divisions and is active in every public forum: Congress, the courts, governmental agencies and the media. Congress Watch is one of the five divisions.

Medical Misdiagnosis: Challenging the Malpractice Claims of the Doctors' Lobby

Executive Summary

The major findings in this report are the following:

Doctors’ Attacks on the Tort System Are a Misdiagnosis that Diverts Attention from an Epidemic of Medical Errors and Unsafe Practices

- Between 44,000 to 98,000 Americans die in hospitals each year due to preventable medical errors, according to the Institute of Medicine (IOM). By comparison, the annual death toll is 43,000 from automobile accidents, 42,000 from breast cancer, and 15,000 from AIDS.

- The costs of doctor negligence and the medical liability system is much greater for patients than doctors. The IOM estimates the annual costs to society for medical errors in hospitals at $17 billion to $29 billion. These costs include disability and health care costs, lost income, lost household production and the personal costs of care. They do not include medical malpractice occurring outside the hospital setting. By contrast, the National Association of Insurance Commissioners reports that the total amount spent on medical malpractice insurance in 2000 was $6.4 billion – at least three to five times less than the costs of malpractice to society.

Rather than Facing “Runaway Litigation,” Doctors Benefit from a Claims Gap

- The landmark Harvard Medical Practice Study and other studies have found that only a small percentage of medical errors result in lawsuits. Twelve years ago, Harvard researchers found that only one in eight medical errors committed in hospitals results in a malpractice claim. Researchers replicating this study made similar findings in Utah and Colorado. From 1996 through 1999, Florida hospitals reported 19,885 incidents but only 3,177 medical malpractice claims. In other words, for every 6 medical errors only 1 claim is filed.

- Malpractice insurance costs amount to only 3.2 percent of the average physician's revenues. According to experts at the Medicare Payment Advisory Commission (MedPAC), liability insurance premiums make up just a tiny part of a physician’s expenses and have increased by only 4.4 percent over the past year. The increase in this expense is noticeable primarily because of the decreases in reimbursements that doctors are receiving from HMOs and government health programs.
Increases in Medical Malpractice Premiums and Payments Track — And Do Not Exceed — Increased Costs of Injuries

- **Malpractice insurance costs have risen at half the rate of medical inflation, debunking the myth of “out-of-control juries.”** While medical costs have increased by 113 percent since 1987, the total amount spent on medical malpractice insurance has increased by just 52 percent over that time—less than half of medical services inflation.

- **Government data shows that medical malpractice awards have increased at a much slower pace than claimed by Jury Verdict Research.** According to the federal government’s National Practitioner Data Bank (NPDB), the median medical malpractice payment by a physician to a patient rose 35 percent from 1997 to 2001, from $100,000 to $135,000. By contrast, data from Jury Verdict Research (JVR), a private research firm, shows that awards rose 100 percent from 1997 to 2000, from $503,000 to $1 million. The reasons for the huge difference: JVR only collects jury verdict information that is reported to it by attorneys, court clerks and stringers. The NPDB is the most comprehensive source of information that exists because it includes both verdicts and settlements. Ninety-six percent of all medical malpractice cases are settled, as opposed to decided by a jury, and settlements result in much lower awards than jury verdicts.

- **Government data shows that medical malpractice awards have increased at a slower pace than health insurance premiums.** According to the federal government’s National Practitioner Data Bank, the median medical malpractice payment by a physician to a patient rose 35 percent from 1997 to 2000, from $100,000 to $135,000. But during the same time, the average premium for single health insurance coverage has increased by 39 percent. [See Figure, “Growth in Health Insurance Costs and Malpractice Awards Compared.”] Payments for health care costs, which directly affect health insurance premiums, make up the lion’s share of most medical malpractice awards.

The Spike in Medical Liability Premiums Was Caused by the Insurance Cycle, Not By New Claims or “Skyrocketing” Jury Verdicts

- **For much of the 1990s, doctors benefited from artificially lower premiums.** According to the International Risk Management Institute (IRMI), one of the leading analysts of commercial insurance issues, “What is happening to the market for medical malpractice insurance in 2001 is a direct result of trends and events present since the mid to late 1990s. Throughout the 1990s, and reaching a peak around 1997 and 1998, insurers were on a quest for market share, that is, they were driven more by the amount of premium they could book rather than the adequacy of premiums to pay losses. In large part this emphasis on market share was driven by a desire to accumulate large amounts of capital with which to turn into investment income.” IRMI also noted: “Clearly a business cannot continue operating in that fashion indefinitely.”
• **One major insurer appears to have triggered a “crisis” in at least four states studied.** Case studies on Mississippi, Nevada, Pennsylvania, and West Virginia in this briefing book show that the “crisis” in at least these four states was triggered after a leading company, The St. Paul Companies, Inc., withdrew from the medical liability marketplace in December 2001. That decision had more to do with St. Paul’s reckless cash flow policies than it did with malpractice claims or jury awards.

• **Medical liability premiums track investment results.** J. Robert Hunter, one of the country’s most knowledgeable insurance actuaries and director of insurance for Consumer Federation of America, recently analyzed the growth in medical liability premiums. He found that premiums charged do not track losses paid, but instead rise and fall in concert with the state of the economy. When the economy is booming and investment returns are high, companies maintain premiums at modest levels; however, when the economy falters and interest rates fall, companies increase premiums in response.

• **There is no growth in the number of new medical malpractice claims.** According to the National Association of Insurance Commissioners (NAIC), the number of new medical malpractice claims declined by about four percent between 1995 and 2000. There were 90,212 claims filed in 1995; 84,741 in 1996; 85,613 in 1997; 86,211 in 1998; 89,311 in 1999; and 86,480 in 2000.

  “Repeat Offender” Physicians Are Responsible for the Bulk of Medical Malpractice Costs

• **Five percent of doctors are responsible for 54 percent of malpractice in the U.S.** Public Citizen’s analysis of the National Practitioner Data Bank, which covers malpractice judgments and settlements since September 1990, found that 5.1 percent of doctors (35,009) have paid two or more malpractice awards to patients. These doctors are responsible for 54 percent of all payouts reported to the Data Bank. Of these, only 7.6 percent have ever been disciplined by state medical boards. Even physicians who have made 5 payouts have been disciplined at only a 13.3 percent rate.

**Few, If Any, Malpractice Lawsuits Are “Frivolous”**

• **Plaintiffs drop ten times more claims than they pursue.** Based on Physician Insurer Association of America (PIAA) figures, Public Citizen estimates that about 54 percent of claims are being abandoned by patients. Attorneys often may send a statutorily required notice of intent to claim or file a lawsuit in order to meet the requirements of the statute of limitations but, after collecting medical records and consulting with experts, decide not to pursue the claim. We estimate that the number of cases withdrawn voluntarily by plaintiffs was 92,621, *ten times* the number of cases that were taken to trial and lost during that period (9,293). The percentage of claims pursued by plaintiffs to final rejection by a jury is only *five percent.*
• **The small number of claims pursued to a defense verdict are not frivolous.** Researchers at the American Society of Anesthesiologists arranged for pairs of doctors to review 103 randomly selected medical negligence claims files. The doctors were asked to judge whether the anesthesiologist in question had acted reasonably and prudently. The doctors only agreed on the appropriateness of care in 62 percent of the cases; they disagreed in 38 percent of cases. The researchers concluded, “These observations indicate that neutral experts (the reviews were conducted in a situation that did not involve advocacy or financial compensation) commonly disagree in their assessments when using the accepted standard of reasonable and prudent care.”

**So-called “Non-Economic” Damages Are Real and Not Awarded Randomly**

• **“Non-economic” damages aren’t as easy to quantify as lost wages or medical bills, but they compensate real injuries.** So-called “non-economic” damages are awarded for the pain and suffering that accompany any loss of normal functions (e.g. blindness, paralysis, sexual dysfunction, lost bowel and bladder control) and inability to engage in daily activities or to pursue hobbies, such as hunting and fishing. This category also encompasses damages for disfigurement and loss of fertility. According to PIAA, the average payment between 1985 and 2001 for a “grave injury,” which encompasses paralysis, was only $454,454.

• **No evidence supports the claim that jury verdicts are random “jackpots.”** Studies conducted in California, Florida, North Carolina, New York, and Ohio have found that jury verdicts bear a reasonable relationship to the severity of the harm suffered. In total the studies examined more than 3,500 medical malpractice jury verdicts and found a consistent relationship between the severity of the injury and the size of the verdict. Uniformly the authors concluded that their findings did not support the contention that jury verdicts are frequently unpredictable and irrational.

**Empirical Evidence Does not Confirm the Existence of “Defensive Medicine” — Patient Injuries Refute It**

• **The Congressional Budget Office has rejected the defensive medicine theory.** CBO was asked to quantify the savings from reduced “defensive medicine” if Congress passed H.R. 4600. This bill, which passed the House in 2002, contained very stringent restrictions on a patient’s ability to recover damages. CBO declined, saying that any such “estimates are speculative in nature, relying, for the most part, on surveys of physicians' responses to hypothetical clinical situations, and clinical studies of the effectiveness of certain intensive treatments. Compounding the uncertainty about the magnitude of spending for defensive medicine, there is little empirical evidence on the effect of medical malpractice tort controls on spending for defensive medicine and, more generally, on overall health care spending. Using broader measures of spending, CBO’s initial analysis could find no statistically significant connection between malpractice tort limits and overall health care spending.”
Solutions to Reduce Medical Errors and Long-term Insurance Rates

- **Implement patient safety measures proposed by the Institute of Medicine.** The “systems approach” to patient safety advocated by the Institute of Medicine shows promise. Some three years after the release of its report little has been done to establish mandatory nationwide error reporting systems, identify unsafe practices, or raise performance standards. Although experts using the systems approach have identified a number of promising strategies to reduce malpractice, few have been implemented.

- **Open the National Practitioner Data Bank.** Information about doctor discipline, including state sanctions, hospital disciplinary actions and medical malpractice awards is now contained in the National Practitioner Data Bank. HMOs, hospitals and medical boards can look at the National Practitioner Data Bank but consumers cannot, because the names of physicians in the database are kept secret from the public. Congress should lift the veil of secrecy and allow the people who have the most to lose from questionable doctors to get the information they need to protect themselves and their families.

- **Improve oversight of physicians.** Less than one-half of one percent of the nation’s doctors face any serious state sanctions each year. 2,708 total serious disciplinary actions a year, the number state medical boards took in 2001, are a pittance given estimates that between 44,000 and 98,000 deaths of hospitalized patients are caused by medical errors annually. State medical boards should be strengthened and more doctors should be disciplined for incompetence.

- **Limit physicians’ workweek to reduce hazards created by fatigue.** American medical residents work among the highest—if not the highest—number of hours in the professional world. They work up to 120 hours a week, including 36-hour shifts for several weeks at a time. After 24 hours of wakefulness, cognitive function deteriorates to a level equivalent to having a 0.10% blood alcohol level. In other words, doctors who would be considered too unsafe to drive may still treat patients for 12 more hours. Residents should be limited to an 80-hour workweek.
Introduction

In November 1999, the Institute of Medicine released its report on patient safety in the U.S. The report’s findings were shocking – that between 44,000 and 98,000 Americans die annually as a result of preventable medical errors. But the report raised hopes among consumer advocates that what we knew to be a major public health problem would finally be addressed by policymakers.

Unfortunately, the public’s hopes were quickly dashed. The economic downturn that began the following year, and which in turn led to an insurance market decline, led to stiff but temporary increases in medical liability premiums. The medical community saw the rate hikes as a golden lobbying opportunity. Medical providers ceased negotiations on patient safety legislation, and for the third time in as many decades, they declared war on our legal system.

The tactics that have been employed in their war are deplorable. The first casualty was the truth. Doctors and their lobbyists claim that hard-working American citizens undergo a hideous transformation when they take a juror’s oath: they become part of “out-of-control” juries and issue “skyrocketing” verdicts. Such verdicts, say the medical lobby, are the cause of increased liability premiums.

This report demonstrates the falsity of this charge. The facts are these: Insurance premiums are rising as a result of a business cycle wholly unrelated to tort claims. New claims filings are flat. Liability insurance expenditures and victim compensation are barely keeping pace with increases in health care costs. Only a fraction of patients harmed by malpractice ever seek compensation.

The doctors’ message has been, “Give us what we want or we’ll pull out of your community.” Essentially we’re blackmailed into suspending all manner of reasonable judgment – to believe that a sudden jump in premiums over the last two years is caused by anything other than investment company losses. In fact, it typically takes five years for a malpractice case to work its way through the system.

It would be a travesty of justice for Congress and state legislatures to take away patients’ legal rights in the name of protecting insurance company profits and doctors’ income. Caps on damages hurt those most seriously injured. The fact is that the legal system is all patients have to ensure just compensation for injury and to force improvements in patient safety. It’s clear that the current regulatory system is not up to the task.

Our goal in issuing this briefing book is not just to refute the phony charges. The underlying problem of sloppy medical care urgently needs to be addressed. Doctors and hospitals have been able to shift the costs of their carelessness onto victims. This “compensation gap” has allowed the medical community to ignore the problem of medical errors.

It is very unfortunate that rather than reducing the real threats that current medical care poses to their patients, the doctor’s lobby has proposed to shift the costs of injuries onto innocent individuals, their families, voluntary organizations and taxpayers. Doctors, patients and consumers should be allies on this issue – which fundamentally comes down to improving the quality of medical care in the U.S. – not be pitted against each other.
Doctors’ Attacks on the Tort System Are a Misdiagnosis that Diverts Attention from an Epidemic of Medical Errors and Unsafe Practices

- Between 44,000 to 98,000 Americans die in hospitals each year due to preventable medical errors, according to the Institute of Medicine.\(^1\) By comparison the annual death toll from automobile accidents is 43,000, 42,000 die from breast cancer and 15,000 die from AIDS. The IOM estimates the costs to society for these medical errors at $17 billion to $29 billion. These costs include disability and health care costs, lost income, lost household production and the personal costs of care. These figures do not take account of medical malpractice occurring outside the hospital setting.

- Medical journals, state reporting systems and news accounts document continuing, widespread disregard for patient safety.

  Hospital infections. The Chicago Tribune reported that some 75,000 Americans die each year because of infections acquired in hospitals that “were preventable, the result of unsanitary facilities, germ-laden instruments, unwashed hands and other lapses.”\(^2\)

  Medication errors. Two recent studies have found numerous errors in administering medication to hospitalized patients. An Auburn University study of 36 hospitals and nursing homes in Colorado and Georgia found that on average, 19 percent of medication doses were given in error, with 7 percent judged to be potentially harmful.\(^3\) The authors said this amounts to about 40 potential adverse drug events per day in a typical 300-patient facility.

  Wrong-patient surgery. According to a study published in the Annals of Internal Medicine, New York hospitals reported 27 instances of invasive procedures performed on the wrong patient between April 1998 and December 2001.\(^4\) (There were nine such instances in Florida in 2001.\(^5\)) In trying to determine how such shocking errors could occur, the New York researchers analyzed one case in detail. The case study determined that medical personnel had ignored “many seemingly clear signals that they were subjecting the wrong patient to an invasive procedure.”

- The resources devoted to preventing medical errors are disproportionate to their toll in lives. Deaths attributable to medical errors each year exceed those caused by breast cancer and AIDS. Yet while the federal government spends $655 million on breast cancer prevention\(^6\) and $3.5 billion on AIDS prevention,\(^7\) only about $130 million has been committed this year, for the first time, for improving patient safety.\(^8\)

- Physicians’ cavalier attitudes toward medical errors are out of step with public opinion. The New England Journal of Medicine recently released a survey of physicians and the public on the issue of medical errors.\(^9\) The public understands this problem far better than do physicians. The public is more likely than physicians to agree with patient safety experts’ assessments of how to reduce medical errors. The public understands the need for
better nurse staffing. The public understands the role of fatigue in causing injuries to patients. The public wants hospitals to develop patient safety systems. The public wants computerized prescriptions and medical records. The public wants mandatory reporting of medical errors. The public wants stronger disciplining of doctors. On each of these issues, doctors are in significant disagreement with the public and with the experts.

- **Doctors’ views on accountability for medical errors are out of step with the public's.** The respondents to the *(New England Journal of Medicine)* survey were given a hypothetical case of a doctor ordering the use of an antibiotic for a patient whose medical record noted an allergy, and who subsequently died. The vast majority of the lay respondents to this survey thought that such a doctor should be held accountable, both through a malpractice lawsuit and through disciplinary proceedings. Significantly fewer doctors felt the same. Doctors are promoting an approach to public policy with which the general public simply does not agree with.

2 Berens, “Infection Epidemic Carves Deadly Path,” *Chicago Tribune,* July 21, 2002. This number is attributed to the “Tribune’s analysis, which adopted methods commonly used by epidemiologists.”
Rather than Facing “Runaway Litigation,”
Doctors Benefit from a Claims Gap

• **The landmark Harvard Medical Practice Study found that only a small percentage of medical errors result in lawsuits.** Twelve years ago, Harvard researchers using a sample of hospitalizations in New York State compared medical records to claims files. They found that only one in eight medical errors committed in hospitals results in a malpractice claim.¹ Researchers replicating this study made similar findings in Colorado and Utah.² [See figure “Malpractice Claims Gap: Ratio of Medical Errors to Claims Filed.”]

• **Actual numbers collected by government agencies show a similar claims gap.** A Florida statute requires hospitals to report “adverse incidents,” defined as “an event over which health care personnel could exercise control” that results in death or injury. Tables prepared by Florida’s Agency for Health Care Administration have compared reports of adverse incidents to filing of new malpractice claims. From 1996 through 1999, Florida hospitals reported 19,885 incidents but only 3,177 medical malpractice claims.³ In other words, for every 6 medical errors only 1 claim is filed. [See figure “Florida Malpractice Claims Gap: 1996-1999 Ratio of Medical Errors to Claims Filed.”]

• **By any measure, it is clear that the number of medical errors far outstrips the number of lawsuits.** On hospital discharge forms, health information management specialists are asked to record an “external cause of injury,” or “E-code” for a patient. A number of codes correspond to “medical misadventures” during surgical and medical care.⁴ Public Citizen obtained E-Code information from those states that collect such data and will supply it either for free or for less than $100. In each of the states for which we were able to obtain accurate data, medical injuries outnumbered compensation payments to injured patients by ratios similar to those found by academic researchers. [See figure “Malpractice Compensation Gap: Hospital E-Code Injuries vs. Malpractice Payments.”]

• **Overall tort expenditures are less than the cost of medical injuries.** Because so few medical injuries result in compensation to patients, the overall expenditures made for medical liability are far below the projected injury costs. The Institute of Medicine estimated the costs of preventable medical injuries in hospitals alone at between $17 billion and $29 billion.⁵ The Utah Colorado Medical Practice study estimated it at $20 billion.⁶ By contrast, the National Association of Insurance Commissioners reports that the total amount spent on medical malpractice insurance in 2000 was $6.4 billion.⁷ This is at least three to five times less than the cost of malpractice to society. [See figure “Malpractice Compensation Gap: Annual Costs of Medical Negligence vs. Medical Liability Expenditures.”]

• **Malpractice insurance costs amount to only 3.2 percent of the average physician’s revenues.** According to experts at the federal government’s Medicare Payment Advisory Commission (MedPAC), who have no axe to grind about medical liability, liability insurance premiums make up just a tiny part of a physician’s expenses and have increased by only 4.4 percent over the last year.⁸ The increase in this expense is
noticeable primarily because of the decreases in reimbursements that doctors are receiving from HMOs and government health programs.

- The compensation gap helps explain why, although medical injuries are costly, expenditures on medical liability comprise less than one percent of overall health care costs. As the Congressional Budget Office reported, “Malpractice costs account for a very small fraction of total health care spending; even a very large reduction in malpractice costs would have a relatively small effect on total health plan premiums. In addition, some of the savings leading to lower medical malpractice premiums—those savings arising from changes in the treatment of collateral-source benefits—would represent a shift in costs from medical malpractice insurance to health insurance.”

---

4 Adverse events characterized as “misadventures” include accidental cuts during surgery, foreign objects left in a patient during surgery, infections caused by failure of sterile precautions, and performance of inappropriate operations. They do not include abnormal reactions and other complications that occur during medical care. A misadventure does not necessarily constitute “medical negligence,” which is a legal term of art. However, a “misadventure” would constitute malpractice if it was a deviation from the standard of care and resulted in more than momentary harm to a patient.

Malpractice Compensation Gap: Annual Costs of Medical Negligence vs. Medical Liability Expenditures

The Costs of Medical Malpractice to Patients and Consumers Versus the Cost to Doctors

The Institute of Medicine has estimated that from 44,000 to 98,000 Americans die in hospitals every year from *preventable* medical errors. The IOM also estimates that these errors cost society $17 billion to $29 billion per year. These costs include disability and health care costs, lost income, lost household production and the personal costs of care. They do not include the costs of medical malpractice that occurs outside the hospital setting. The table below compares these costs, prorated on a state-by-state basis, to the amount that physicians pay in medical malpractice premiums in those states. The costs of medical malpractice to society dwarf the costs to doctors.

Increases in Medical Malpractice Premiums and Payments Track — and Do not Exceed Increased Costs of Injuries

- **Malpractice insurance costs have risen at half the rate of medical inflation, debunking the myth of “out-of-control juries.”** At a July 2002 congressional hearing, Dr. Richard Anderson of The Doctors Company complained that “since 1990, [malpractice] claims costs have risen annually by 6.9 percent, nearly three times the rate of inflation.”¹ The appropriate comparison is to health care inflation, because the bulk of damage awards go to pay medical bills.² But while medical costs have increased by 113 percent since 1987, the total amount spent on medical malpractice insurance has increased by just 52 percent over that time—less than half of medical services inflation.³ [See figure “Medical Care Services Inflation vs. Growth in Malpractice Written Premiums.”]

- **Government data shows that medical malpractice awards have increased at a much slower pace than claimed by Jury Verdict Research.** According to the federal government’s National Practitioner Data Bank (NPDB), the median medical malpractice payment by a physician to a patient rose 35 percent from 1997 to 2001, from $100,000 to $135,000.⁴ By contrast, data from Jury Verdict Research (JVR), a private research firm, shows that awards rose 100 percent from 1997 to 2000, from $503,000 to $1 million.⁵ The reasons for the huge difference: JVR only collects jury verdict information that is reported to it by attorneys, court clerks and stringers. The NPDB is the most comprehensive source of information that exists because it includes both verdicts and settlements. Ninety-six percent of all medical malpractice cases are settled, as opposed to decided by a jury, and settlements result in much lower awards than jury verdicts.

- **Government data shows that medical malpractice awards have increased at a slower pace than health insurance premiums.** According to the federal government’s National Practitioner Data Bank, the median medical malpractice payment by a physician to a patient rose 35 percent from 1997 to 2000, from $100,000 to $135,000.⁶ But during the same time, the average premium for single health insurance coverage has increased by 39 percent.⁷ [See Figure, “Growth in Health Insurance Costs and Malpractice Awards Compared.”] Payments for health care costs, which directly affect health insurance premiums, make up the lion’s share of most medical malpractice awards.

- **Medical malpractice awards are increasing in line with other general social trends.** In addition to medical costs, malpractice awards include two other main elements, lost wages and pain and suffering. These, like medical costs, are in turn multiplied by life expectancy. All of these factors are affected by upward social trends. Juries have not changed their behavior, but the numbers jurors take into account in making awards have changed.

- **Increases in our standard of living lead to higher awards.** Median household income has risen by an average of about $1,000 each year, more than doubling over the past 20 years from $17,710 in 1980 to $42,151 in 2000.⁸ This increase reflects not only inflation but also real increases in our affluence. Higher expectations about quality of life affect the
valuation placed on a victim’s pain and suffering. In years past, sickness and injury were viewed as an inevitable part of life. Today, health and safety are taken for granted, and most Americans expect to live a long, healthy life. Americans place a greater value on physical activity; the International Health, Racquet, and Sportsclub Association reports that health club memberships are increasing at a 9 percent annual rate. It is more likely today that a plaintiff will have regularly engaged in recreational or other physical activities, making a disabling injury all the more severe.

- **Increased life expectancy leads to higher awards.** According to the Center for Disease Control and Prevention, since 1980 the average life expectancy in the United States has increased by three years, from 73.7 to 76.7 years. The retirement age, set by Social Security, has also increased, resulting in longer expected years of employment. The full retirement age is 65 for persons born before 1938. The age gradually rises until it reaches 67 for persons born in 1960 or later.

**Cumulative Change** 35%

The Spike in Medical Liability Premiums Was Caused by the Insurance Cycle, Not by “Skyrocketing” Jury Verdicts

- **For much of the 1990s, doctors benefited from artificially lower premiums.** According to the International Risk Management Institute (IRMI), one of the leading analysts of commercial insurance issues, “What is happening to the market for medical malpractice insurance in 2001 is a direct result of trends and events present since the mid to late 1990s. Throughout the 1990s, and reaching a peak around 1997 and 1998, insurers were on a quest for market share, that is, they were driven more by the amount of premium they could book rather than the adequacy of premiums to pay losses. In large part this emphasis on market share was driven by a desire to accumulate large amounts of capital with which to turn into investment income.” IRMI also noted: “Clearly a business cannot continue operating in that fashion indefinitely.”

- **West Virginia Insurance Commissioner blames the market.** According to the Office of the West Virginia Insurance Commission (one of the states in the throes of a medical malpractice “crisis”), “[T]he insurance industry is cyclical and necessarily competitive. We have witnessed these cycles in the Medical Malpractice line in the mid-’70’s, the mid-80’s and the present situation. This particular cycle is, perhaps, worse than previous cycles as it was delayed by a booming economy in the ’90’s and is now experiencing not just a shortfall in rates due to competition, but a subdued economy, lower interest rates and investment yields, the withdrawal of a major medical malpractice writer and a strong hardening of the reinsurance market. Rates will, at some point, reach an acceptable level to insurers and capital will once again flow into the Medical Malpractice market.”

- **Medical liability premiums track investment results.** J. Robert Hunter, one of the country’s most knowledgeable insurance actuaries and director of insurance for the Consumer Federation of America, recently analyzed the growth in medical liability premiums. He found that premiums charged do not track losses paid, but instead rise and fall in concert with the state of the economy. When the economy is booming and investment returns are high, companies maintain premiums at modest levels; however, when the economy falters and interest rates fall, companies increase premiums in response.

- **The same trends are present in other lines of insurance.** Property/casualty refers to a large group of liability lines of insurance (30 in total) including medical malpractice, homeowners, commercial, and automobile. The property/casualty insurance industry has exhibited cyclical behavior for many years, as far back as the 1920s. These cycles are characterized by periods of rising rates leading to increased profitability. Following a period of solid but not spectacular rates of return, the industry enters a down phase where prices soften, supply of the insurance product becomes plentiful, and, eventually, profitability diminishes, or vanishes completely. In the down phase of the cycle, as results deteriorate, the basic ability of insurance companies to underwrite new business or, for some companies even to renew some existing policies, can be impaired. This is because the capital needed to support the underwriting of risk has been depleted through losses. The current market began
to harden in 2001, following an unusually prolonged period of soft market conditions in the property-casualty section in the 1990s. The current hard market is unusual in that many lines of insurance are affected at the same time, including medical malpractice. As a result, premiums are rising for most types of insurance. The increases have taken policyholders by surprise given that they came after several years of relatively flat to decreasing prices.\(^4\)

- **Insurer mismanagement compounded the problems.** Compounding the impact of the cycle has been misleading accounting practices. As the *Wall Street Journal* found in a front page investigative story on June 24, 2002, “[A] price war that began in the early 1990s led insurers to sell malpractice coverage to obstetrician-gynecologists at rates that proved inadequate to cover claims. Some of these carriers had rushed into malpractice coverage because an accounting practice widely used in the industry made the area seem more profitable in the early 1990s than it really was. A decade of short-sighted price slashing led to industry losses of nearly $3 billion last year.” Moreover, “In at least one case, aggressive pricing allegedly crossed the line into fraud.” According to Donald J. Zuk, chief executive of SCPIE Holdings Inc., a leading malpractice insurer in California,\(^5\) “Regardless of the level of … tort reform, the fact remains that if insurance policies are consistently under-priced, the insurer will lose money.”\(^6\)

- **There is no growth in the number of new medical malpractice claims.** According to the National Association of Insurance Commissioners (NAIC), the number of new medical malpractice claims declined by about four percent between 1995 and 2000. There were 90,212 claims filed in 1995; 84,741 in 1996; 85,613 in 1997; 86,211 in 1998; 89,311 in 1999; and 86,480 in 2000.\(^7\)

**National Association of Insurance Commissioners, Statistical Compilation of Annual Statement Information for Property/Casualty Insurance Companies in 2000**
“Repeat Offender” Physicians Are Responsible for the Bulk of Medical Malpractice Costs

- **Five percent of doctors are responsible for 54 percent of malpractice in the U.S.** Public Citizen’s analysis of the National Practitioner Data Bank, which covers malpractice judgments and settlements since September 1990, found that 5.1 percent of doctors (35,009) have paid two or more malpractice awards to patients. These doctors are responsible for 54 percent of all payouts reported to the Data Bank. Of these, only 7.6% have ever been disciplined by state medical boards. Even physicians who have made 5 payouts have been disciplined at only a 13.3 percent rate.

- **A Vanderbilt University study found that doctors with past records of malpractice claims can be expected to have “appreciably worse claims experience” than other doctors in future years.** Despite the fact that claims history predicts future claims, neither licensing boards nor the insurance market have been effective in reducing malpractice. There are over 6,000 doctors in the U.S. who have paid four or more malpractice claims, amounting to $6.5 billion. These numbers can be expected to grow.

- **Redacted records from the National Practitioner Data Bank demonstrate that lax discipline by medical boards allows questionable doctors to inflict repeated injuries on patients:**

  Physician Number 94358, licensed in New Jersey, settled or lost 33 medical malpractice suits involving improper diagnosis or treatment between 1988 and 1993, inflicting over $400,000 in disability costs to his patients. This doctor has not been disciplined by authorities in New Jersey.

  Physician Number 64625, licensed in Pennsylvania, paid 24 medical malpractice claims involving improper performance of surgery between 1989 and 2001. Damages to this doctor’s patients exceeded $370,000. This doctor has never been disciplined by Pennsylvania authorities.

  Physician Number 125457, while licensed in Nevada, paid five malpractice claims involving improper performance of surgery between 1995 and 1997, with damages totaling $2.3 million. Recent news accounts have reported that doctors are fleeing from Las Vegas to other states to avoid high malpractice insurance premiums. Physician 125457 was ahead of the curve in moving his practice to California. There he paid another eight malpractice claims with damages exceeding $7.5 million. This doctor has never been disciplined by authorities in either Nevada or California.

  Physician Number 37949, licensed in Texas, settled or lost 13 medical malpractice suits involving improper treatment or improper performance of surgery between 1990 and 1997. Two of the suits involved the same allegation—a foreign body left in the patient during surgery. Damages to this doctor’s patients exceeded $2 million. This doctor has never been disciplined by authorities in Texas.

1 Sloan et al, “Medical Malpractice Experience of Physicians: Predictable or Haphazard?” 262 JAMA 3291 (1989)
Few, If Any, Malpractice Lawsuits Are “Frivolous”

- **The contingency fee system discourages attorneys from bringing frivolous claims.** Medical malpractice cases are brought on a contingency fee basis, meaning the attorney receives payment only in the event there is a settlement or verdict. If the claim is closed without payment, the attorney does not receive a fee. Since attorneys must earn money to stay in business, it follows that they would not intentionally take on a non-meritorious case.

- **The high cost of preparing a medical malpractice case discourages frivolous claims—and meritorious claims as well.** Medical malpractice cases are very expensive for plaintiffs’ attorneys to bring, with out-of-pocket costs for cases settled at or near the time of trial (when most cases are settled) ranging from $15,000 to $25,000.\(^1\) If the case goes to trial, the costs can easily be doubled.\(^2\) These costs do not include the plaintiff’s attorney’s time, and an attorney pursuing a frivolous case incurs opportunity costs in not pursuing other cases. An attorney incurs expenses beginning with the determination of whether a case has merit. First, the attorney is required to obtain copies of the patient’s medical records from all the providers for analysis by a competent medically trained person. If that initial consultation reveals a likelihood of medical negligence, the records must then be submitted to medical specialists, qualified to testify in court, for final review. Typically, the records must be sent to experts outside of the plaintiff’s state, as physicians within the state will refuse to testify against local colleagues. As a result, the experts who agree to review records and testify can and do charge substantial fees. Fees from $1,000 per hour to several thousand dollars are not uncommon.\(^3\) Discovery involves taking the sworn testimony of witnesses and experts. Such depositions cost $300 and up, depending upon their length and complexity. If an expert witness is deposed, the plaintiff’s attorney is charged for the witness’ preparation time and time attending the deposition.

- **Plaintiffs drop 10 times more claims than they pursue.** The Physician Insurers Association of America (PIAA) reports that between 1985 and 2001 a total of 108,300 claims were “dropped, withdrawn or dismissed.” This is 63 percent of the total number of claims (172,474) closed during the study period.\(^4\) It is unclear what portion constitutes involuntarily dismissed cases (dismissed after a motion was filed by the defendant) rather than cases voluntarily dismissed by plaintiffs. According to researchers at the University of Washington School of Medicine, about nine percent of claims files are closed after the defendant wins a contested motion.\(^5\) Based on this figure, Public Citizen estimates that about 54 percent of claims are being abandoned by patients.\(^6\) An attorney may send a statutorily-required notice of intent to claim or file a lawsuit in order to meet the requirements of the statute of limitations but, after collecting medical records and consulting with experts, decide not to pursue the claim. We estimate that the number of cases withdrawn voluntarily by plaintiffs\(^7\) was 92,621, 10 times the number of cases that were taken to trial and lost during that period (9,293). The percentage of claims pursued by plaintiffs to final rejection by a jury is only five percent.\(^8\)
• The small number of claims pursued to a defense verdict are not frivolous. Researchers at the American Society of Anesthesiologists arranged for pairs of doctors to review 103 randomly selected medical negligence claims files. The doctors were asked to judge whether the anesthesiologist in question had acted reasonably and prudently. The doctors only agreed on the appropriateness of care in 62 percent of the cases; they disagreed in 38 percent of cases. The researchers concluded, “These observations indicate that neutral experts (the reviews were conducted in a situation that did not involve advocacy or financial compensation) commonly disagree in their assessments when using the accepted standard of reasonable and prudent care.” The percentage of all medical malpractice claims that go to trial is only 6.6 percent, according to PIAA, meaning that the parties and their attorneys ultimately reach agreement about liability five times more often than neutral doctors do. If truly frivolous lawsuits were being pursued, the proportion of claims going to trial would exceed the 38 percent of claims on which even doctors will disagree.

• The costs of defending claims that are ultimately dropped are not unreasonable. Medical liability insurers have complained about the costs of defending cases that are ultimately dropped. But the professional obligation of lawyers to exercise due diligence is essentially identical to the duty of physicians. The lawyer must rule out the possibility of proving medical negligence before terminating a claim, just as doctors must rule out the possibility of illnesses suggested by their patients’ symptoms. The doctor performs his duty by administering tests; the lawyer performs hers by using discovery procedures. Both processes can lead to dead ends. But plaintiffs’ lawyers have no financial incentive to abuse the litigation process: they are using their own time and money to pursue discovery activities, and are only paid for work on behalf of clients whose cases are successful.

1 Based on Public Citizen interviews with plaintiff attorneys.
3 According to the Physician Insurers Association of America, expert witnesses in a medical malpractice case are paid on average over $4,800.
4 Trend Analysis Report, 2001 Edition, 6b-4
6 Another study, Sloan et al, Suing for Medical Malpractice, (1993) found the number was 5.9 percent, not nine percent. According to our queries to the database of Federal District Court Civil Cases, maintained by Professors Theodore Eisenberg and Kevin Clermont, about 4.7 percent of 10,075 medical malpractice cases between 1987 and 1992 were disposed of by pre-trial motion. To make a conservative estimate, however, we are going to use the nine percent figure.
7 .09 times 172,474 equals 15,679; subtracted from 108,300 equals 92,621 claims voluntarily withdrawn.
8 9,293/172,474=.054
So-Called “Non-Economic” Damages Are Real and Not Awarded Randomly

- “Non-economic” damages are not as easy to quantify as lost wages or medical bills, but they compensate real injuries. So-called “non-economic” damages are awarded for the pain and suffering that accompany any loss of normal functions (e.g. blindness, paralysis, sexual dysfunction, lost bowel and bladder control) and inability to engage in daily activities or to pursue hobbies, such as hunting and fishing. This category also encompasses damages for disfigurement and loss of fertility. According to PIAA, the average payment between 1985 and 2001 for a “grave injury,” which encompasses paralysis, was only $454,454.

- No evidence supports the claim that jury verdicts are random “jackpots.” Studies conducted in California, Florida, North Carolina, New York, and Ohio have found that jury verdicts bear a reasonable relationship to the severity of the harm suffered.\(^1\) In total the studies examined more than 3,500 medical malpractice jury verdicts and found a consistent relationship between the severity of the injury and the size of the verdict. Uniformly the authors concluded that their findings did not support the contention that jury verdicts are frequently unpredictable and irrational.

- The insurance industry’s own numbers demonstrate that awards are proportionate to injuries. PIAA’s Data Sharing Report also demonstrates the relationship between the severity of the injury and the size of the settlement or verdict.\(^2\) PIAA, as do most researchers, measures severity of injury according to the National Association of Insurance Commissioners’ classifications.\(^3\) The average indemnity paid per file was $49,947 for the least severe category of injury and increased with severity, to $454,454 for grave injuries. All researchers found that the amount of jury verdicts fell off in cases of death, for which the average indemnity was $195,723. This is not surprising, as the costs of medical treatment for a grave injury are likely to be greater and pain and suffering would be experienced over a longer time period than in the case of death.\(^4\)

---

\(^3\) The NAIC scale grades injury severity as follows:

- Emotional damage only (fright; no physical injury);
- Temporary insignificant (lacerations, contusions, minor scars);
- Temporary minor (infections, fall in hospital, recovery delayed);
- Temporary major (burns, surgical material left, drug side-effects);
- Permanent minor (loss of fingers, loss or damage to organs);
- Permanent significant (deafness, loss of limb, loss of eye, kidney or lung);
- Permanent major (paraplegia, blindness, loss of two limbs, brain damage);
- Permanent grave (quadriplegia, severe brain damage, lifelong care or fatal prognosis);
- Death

Insurance Companies and Their Lobbyists Admit It:
Caps on Damages Won’t Lower Insurance Premiums

Caps on damages for pain and suffering will significantly lower awards to catastrophically injured patients. But because those truly severe cases make up a small percentage of medical malpractice claims, and because the portion of the medical liability premium dollar that pays for compensation is dwarfed by the portion that pays for defense lawyer fees, caps do not lead to lower premiums. Insurance companies and their lobbyists understand this—so don’t take our word for it, take theirs.

A Premium on the Truth

“Insurers never promised that tort reform would achieve specific savings.” – American Insurance Association¹

“We wouldn’t tell you or anyone that the reason to pass tort reform would be to reduce insurance rates.” – Sherman Joyce, president of the American Tort Reform Association²

“Many tort reform advocates do not contend that restricting litigation will lower insurance rates, and I’ve never said that in 30 years.” – Victor Schwartz, general counsel to the American Tort Reform Association³

Mississippi

“Regardless of what may result from the ongoing tort reform debate, please remember that such proposed public policy changes are critical for the long-term, but do not provide a magical ‘silver-bullet’ that will immediately affect medical malpractice insurance rates … The 2003 rate change [a 45 percent increase] would happen regardless of the special session outcome.” – Medical Assurance Company of Mississippi⁴

Nevada

“The primary insurer for Las Vegas obstetricians, American Physicians Assurance, has no plans to lower premiums for several years, if ever, said broker Dennis Coffin.” – The Las Vegas Review-Journal⁵

“[John Cotton of the Nevada Physicians’ Task Force] noted that even if the bill reflected a cap of $5, there would not be an immediate impact on premiums.” – Minutes of the Nevada Assembly Committee on Medical Malpractice Issues⁶

New Jersey

During a hearing on medical malpractice issues, New Jersey Assemblyman Paul D’Amato asked Patricia Costante, Chairwoman and CEO of MIIX Group of Companies, “[A]re you telling the insured physicians in New Jersey that if this State Legislature passes caps that you’ll guarantee that you won’t raise your premiums, in fact, you’ll reduce them?” Costante replied: “No, I’m not telling you [or them] that.”⁷

Empirical Evidence Does not Confirm the Existence of “Defensive Medicine” — Patient Injuries Refute It

- A search of the scholarly literature on medicine will turn up dozens of studies documenting the incidence of medical errors, but not one peer-reviewed study documenting purely defensive medicine. One might laugh at the spectacle of a lobbying campaign constructed around a flimsy theory unsupported by any empirical evidence. Unfortunately, the evidence disproving the theory is so overwhelming and compelling as to be truly frightening. Several recent studies demonstrate that current disincentives to unsafe and sloppy practices are inadequate, and show how much more dangerous medical care would be if deterrents were further weakened.

- The Congressional Budget Office has rejected the defensive medicine theory. The Congressional Budget Office (CBO) was asked to quantify the savings from reduced “defensive medicine” if Congress passed H.R. 4600. This bill, which contained very stringent restrictions on patients’ ability to recover damages, passed the U.S. House in 2002. CBO declined, saying:

Estimating the amount of health care spending attributable to defensive medicine is difficult. Most estimates are speculative in nature, relying, for the most part, on surveys of physicians’ responses to hypothetical clinical situations, and clinical studies of the effectiveness of certain intensive treatments. Compounding the uncertainty about the magnitude of spending for defensive medicine, there is little empirical evidence on the effect of medical malpractice tort controls on spending for defensive medicine and, more generally, on overall health care spending.

A small number of studies have observed reductions in health care spending correlated with changes in tort law, but that research was based largely on a narrow part of the population and considered only hospital spending for a small number of ailments that are disproportionately likely to experience malpractice claims. Using broader measures of spending, CBO’s initial analysis could find no statistically significant connection between malpractice tort limits and overall health care spending. Although the provisions of H.R. 4600 could result in the initiation of fewer lawsuits, the economic incentives for individual physicians or hospitals to practice defensive medicine would appear to be little changed.¹

- Defensive medicine hasn’t prevented wrong-patient surgery. New York hospitals reported 27 instances of invasive procedures performed on the wrong patient between April 1998 and December 2001.² There were nine such instances in Florida in 2001.³ In trying to determine how such shocking errors could occur, researchers analyzed one case in detail. The case study determined that medical personnel had ignored “many seemingly clear signals that they were subjecting the wrong patient to an invasive procedure.” In this case, “defensive medicine” measures would have included follow-up questioning or record-checking when the patient told personnel she had not been admitted for cardiac treatment. Surely if the medical providers were frightened of lawsuits they would have made such minimal inquiries.
• **Defensive medicine hasn’t prevented medication errors.** An Auburn University study of 36 hospitals and nursing homes in Colorado and Georgia found that on average, 19 percent of medication doses were given in error, with 7 percent judged to be potentially harmful.⁴ The authors said this amounts to about 40 potential adverse drug events per day in a typical 300-patient facility. The errors were made in spite of the presence of observers from the research team—who could easily have been called as witnesses in a medical liability lawsuit. An earlier study by Boston researchers estimated that there are some 500 preventable adverse drug events in the average hospital each year, in spite of the fact that “drug injuries frequently result in malpractice claims, and in a large study of closed claims… accounted for the highest total expenditure of any type of procedure-related injury.”⁵

• **Defensive medicine hasn’t prevented mammography errors.** The *New York Times* reported in June 2002 some very disturbing facts about errors committed by radiologists in reading mammograms.⁶ The theory of defensive medicine predicts that radiologists would err on the side of caution, and detect more false positives than false negatives. Unfortunately the opposite is true, with studies indicating that some doctors and clinics miss as many as one in three cancers. Despite the possibility of lawsuits, doctors with no aptitude for mammography continue to read mammograms. Clinics continue to employ doctors who read too few mammograms to keep their skills sharp. It appears that only reviews by regulators spur doctors and clinics to meet minimum standards.

• **Defensive medicine hasn’t prevented hospital infections.** The *Chicago Tribune* reported on July 21, 2002 that some 75,000 Americans die each year because of infections acquired in hospitals that “were preventable, the result of unsanitary facilities, germ-laden instruments, unwashed hands and other lapses.”⁷ If medical providers fear being sued over the slightest lapse, why would doctors and nurses neglect to take the most elementary precautions of washing their hands and changing scrub uniforms? Why would American hospitals “have collectively pared cleaning staffs by 25 percent since 1995”?⁸ Previously, consultants retained by medical provider groups have argued that medical providers *overspend* on precautionary measures by five to nine percent.⁹

• **Defensive medicine hasn’t caused hospitals to keep nursing staffs up-to-strength.** Two reports published in the past six months concluded that patients in hospitals where nurses had heavier workloads had a higher risk of dying.¹⁰ One report found specifically that each additional patient per nurse corresponded to a seven percent increase in both patient mortality and deaths following complications.¹¹ Nevertheless, nursing shortages persist, even though the defensive medicine theory predicts over-staffing.

Doctors’ Aversion to Settlements May Increase Malpractice Insurance Costs

• **Medical malpractice insurers market their product based on aggressive defenses, not on low costs.** The Doctors Company, a leading doctor-owned insurer, states on its website: “When litigation is necessary, we dedicate more resources than our competitors to defend your good name. Our claims representatives and defense attorneys combine their knowledge of regional laws and jury experience to develop aggressive, successful, defense strategies… We will not consent to settle without your written permission.” (emphasis theirs)¹ In other lines of insurance coverage, claims managers dispassionately evaluate the insured’s exposure and make an objective decision as to whether to settle the claim. This rational calculation takes a back seat to pride and other emotional considerations when medical malpractice insurance is involved.

• **The result is that defense attorney fees are higher and verdicts are higher, pushing malpractice premiums higher.** According to A.M. Best figures cited on The Doctors Company website, the average doctor-owned medical malpractice insurer spends 32 percent of premiums on defense costs. The Doctors Company entices customers by boasting that 49 percent of its premiums are spent on defense costs.² A study by the West Virginia Insurance Commissioner found that one company spends 88 cents of each premium dollar on defense lawyers.

• **Malpractice insurance defense costs far exceed defense costs in other lines of insurance.** According to NAIC figures, defense costs incurred as a portion of direct premiums written amount to 4.8 percent for passenger auto liability, 7.1 percent for commercial auto liability, 16.5 for commercial general liability, and 28.9 percent for product liability.³ Malpractice insurers seldom settle a case before the eve of trial, waiting until discovery is complete. They also take three times more cases to trial than other civil defendants. In 2000, the overall percentage of federal civil cases going to trial was 2.2, but 6.8 percent of medical malpractice cases went to trial.⁴

• **In reality, the liability insurance purchased by doctors is not just for risk management; it is also a public relations tool.** The Doctors Company and Medical Assurance both use the motto “Defending your reputation” in marketing themselves.⁵ Kansas Medical Mutual Insurance Company (KaMMCO) cites “the existence of the National Practitioner Data Bank” as a reason that it is “more important than ever for health care professionals… to defend themselves against allegations of wrongdoing.”⁶ Doctors’ complaints about high premiums must be viewed skeptically when much of the price quoted may pay for services entirely unrelated to managing risks of patient care.⁷

• **Evidence indicates that the negotiation process in medical malpractice cases fails, directly leading to the high verdicts that doctors complain about.** Pursuing a hardball defense strategy guided by emotion rather than reason will also affect the parties’ ability to negotiate rational settlements. An Ohio State study compared medical and product liability negotiations. It found that product liability defense attorneys “correctly” predicted
jury outcomes (i.e. rejected plaintiff demands that were higher than the jury’s eventual verdict) in 12 of the 14 cases studied. By contrast, defense attorneys made the correct settlement decision in only eight of 17 medical malpractice cases in the study. In one case, the defendant rejected a demand of $2 million only to be hit with a judgment for more than $8 million. The authors concluded that, “In malpractice cases, plaintiffs gained more than defendants from rejecting settlement offers and proceeding to trial. In product liability cases, defendants gained more than plaintiffs from eschewing settlement and defending claims in court… It appears that malpractice defendants—rather than plaintiffs—may be somewhat too inclined to resist settlement and push cases to trial.”

2 Id.
6 http://www.kammco-msc.com
7 Other “extras” that may be included in the price of malpractice insurance include Defendant Reimbursement Coverage, that pays a doctor $500 per day to attend a trial, offered by ISMIE; and “defense coverage associated with the investigation of Medicare and Medicaid billing errors, regulatory agency actions, and… an initial consultation with an attorney to discuss potential countersuits,” offered by KaMMCO.
Solutions to Reduce Medical Errors
and Long-term Insurance Rates

Implement Patient Safety Measures Proposed by the Institute of Medicine

Public Citizen believes in personal responsibility and accountability for negligence as one of the principal methods for deterring medical errors. Nevertheless, we acknowledge that the “systems approach” to patient safety advocated by the Institute of Medicine shows considerable promise. We are disappointed that some three years after the release of its report, almost nothing has been done to establish mandatory nationwide error reporting systems, identify unsafe practices, or raise performance standards.

- **Medication errors are among the most common preventable mistakes, but safety systems have been put in place in very few hospitals.** Although experts using the systems approach have identified a number of promising strategies to reduce malpractice, few have been implemented. Experts have estimated that more than one million serious drug errors occur annually in hospitals alone.\(^1\) Recent studies show that computer physician order entry (CPOE) systems can reduce error rates by 55 percent.\(^2\) CPOE is an electronic prescribing system that intercepts errors where they most commonly occur – at the time medications are ordered. Physicians enter orders into a computer, rather than on paper. Orders are automatically checked for potential problems, such as drug interactions or allergies. CPOE also resolves problems associated with deciphering doctors’ notoriously bad handwriting. But in spite of these benefits, fewer than three percent of hospitals have fully implemented CPOE.\(^3\)

- **Evidence-based hospital referral could save 4,000 lives every year, but has not been implemented.** Evidence-based hospital referral means directing patients with high-risk conditions to hospitals with characteristics shown to be associated with better outcomes. Dr. Adams Dudley, a researcher at the University of San Francisco at California, identified 10 surgical procedures for which outcomes were strongly related to hospital volume. Using data from California hospitals, he estimated that using evidence-based hospital referral for those 10 procedures would prevent over 4,000 deaths across the U.S. each year.\(^4\)

- **Surgery performed on the wrong part of the body, to the wrong patient, and performing the wrong procedure on a patient are all completely preventable, yet continue to occur.** Such mistakes should never happen, according to a special alert reissued December 5, 2001 by the Joint Commission on Accreditation of Healthcare Organizations.\(^5\) To prevent these accidents, the JCAHO recommends the surgical site be marked with a permanent marker. Sometimes referred to as “signing your site,” doctors place their initials on the surgical site with a permanent marking pen in a way that cannot be overlooked and then actually operate through or next to the initials. JCAHO also recommends orally verifying the surgery in the operating room just before starting the operation.\(^6\) Nevertheless, during 2001 in Florida hospitals alone there were 54 surgeries on the wrong part of the body, 16 wrong procedures performed and nine wrong patient
surgeries. Had Florida mandated the JCAHO recommendations in 2000, these 79 incidents would not have occurred.

**Open the National Practitioner Data Bank to Empower Consumers with Information About Their Doctors**

Information about doctor discipline, including state sanctions, hospital disciplinary actions and medical malpractice awards is now contained in the National Practitioner Data Bank. HMOs, hospitals and medical boards can look at the National Practitioner Data Bank. Unfortunately, consumers cannot because the names of physicians in the database are kept secret from the public. Congress should lift the veil of secrecy and allow the people who have the most to lose from questionable doctors to get the information they need to protect themselves and their families.

**Limit Physicians’ Workweek to Reduce Hazards Created by Fatigue**

American medical residents work among the highest—if not the highest—number of hours in the professional world. They work up to 120 hours a week, including 36-hour shifts for several weeks at a time. After 24 hours of wakefulness, cognitive function deteriorates to a level equivalent to having a 0.10 percent blood alcohol level. In other words, doctors who would be considered too unsafe to drive may still treat patients for 12 more hours. 41 percent of resident-physicians attribute their most serious mistake in the previous year to fatigue. 45 percent of residents who sleep less than four hours per night report committing medical errors. Working these extreme hours for years at a time also has ill-effects on doctors’ own personal health and safety. Multiple studies in the medical literature demonstrate that sleep-deprived and overworked residents are at increased risk of being involved in motor vehicle collisions, suffering from depressed mood and depression, and giving birth to growth-retarded and/or premature infants. If the maximum workweek for residents was limited to 80 hours it could considerably reduce mistakes due to fatigue and lack of supervision.

**Refine the Malpractice Insurance System**

The number of classifications of doctor specialties for insurance rating purposes should be reduced to more broadly spread the risk. Risk pools for some are too small and thus overly influenced by a few losses and the concentration in a few specialties of doctors handling the highest risk patients. Often the high-risk patients are “referred up” from general practitioners who do not bear any of the risk.

**Improve Oversight of Physicians**

Public Citizen has long sought greater consumer access to information about doctors, and there have been recent improvements in making that information available. Most state medical boards now provide some physician information on the Internet, but the information about disciplinary actions varies greatly, is often inadequate and can be difficult for people to access.
For more than a decade, Public Citizen’s Health Research Group has been carefully scrutinizing the performance of state medical boards. As reported in our *Questionable Doctors* publication,¹⁴ too little discipline is being done. Too many state medical boards, despite their duty to protect the public, still believe their first responsibility is to rehabilitate “impaired physicians” and shield them from the public’s prying eyes. Fewer than one-half of one percent of the nation’s doctors face any serious state sanctions each year. 2,708 total serious disciplinary actions a year, the number state medical boards took in 2001, are a pittance given estimates that between 44,000 and 98,000 deaths of hospitalized patients are caused by medical errors annually.

State discipline rates ranged from 10.52 serious actions per 1,000 doctors (Arizona) to 0.73 actions per 1,000 physicians (District of Columbia), a 14.4-fold difference between the best and worst states. If all the boards did as good a job as the lowest of the top five boards, Kentucky’s rate of 6.32 serious disciplinary actions per 1,000 physicians, it would amount to a total of 5,089 serious actions a year. That would be 2,381 more serious actions than the 2,708 that actually occurred in 2001. It is likely that patients are being injured or killed more often in states with poor doctor disciplinary records than in states with consistent top performances.

Negligent doctors are rarely disciplined with loss or suspension of their license for inferior care. Instead, state medical boards focus on more easily documentable offenses such as prescription drug violations and fraud convictions or disciplinary action in another state as potential indicators of substandard care. Congress could encourage better oversight through grants to state medical boards, tied to the boards’ agreements to meet performance standards. The following state reforms would help protect patients:

- **Reform medical board governance.** States should sever any remaining formal, debilitating links between state licensing boards and state medical societies. Members of medical boards (and separate disciplinary boards, where present) should be appointed by the governor, and the governor’s choice of appointees should not be limited to a medical society’s nominees. At least 50 percent of the members of each state medical board and disciplinary board should be well-informed and well-trained public members who have no ties to health care providers and who, preferably, have a history of advocacy on behalf of patients. The governor should appoint members to the Medical Board whose top priority is protecting the public’s health, not providing assistance to physicians who are trying to evade disciplinary actions.

- **Beef up medical board funding and staffing.** State legislatures should permit medical boards to spend all the revenue from medical licensing fees, rather than being forced to give part to the state treasury. The medical boards should raise their fees to $500 a year. All boards could benefit from hiring new investigators and legal staff. Boards should employ adequate staff to process and investigate all complaints within 30 days, to review all malpractice claims filed with the board, to monitor and regularly visit doctors who have been disciplined to ensure their compliance with the sanctions imposed, and to ensure compliance with reporting requirements. They should hire investigators to seek out errant doctors, through review of pharmacy records, consultation with medical examiners, and targeted office audits of those doctors practicing alone and suspected of poor care.
• **Require risk prevention.** States should adopt a law, similar to one in Massachusetts, that requires all hospitals and other health care providers to have a meaningful, functioning risk prevention program designed to prevent injury to patients. Massachusetts also requires all adverse incidents occurring in hospitals or in doctors’ offices to be reported to the medical board.

• **Require periodic recertification of doctors based on a written exam and audit of their patients’ medical care records.**

Politicians Should Reject Proposals that Reduce Accountability for Negligence

There are three main critiques of the legal system that have been offered to justify changes to medical liability laws.

The first is that the system sometimes reaches erroneous results. Nobody would contend that any institution relying on fallible human beings is perfect. Fortunately, the legal system provides far more back-ups than other institutions in our society, through its transparency and its extensive appellate process. Judges can, and do, reverse decisions of juries when they act with passion or prejudice, as well as review decisions of lower courts. In recent years, the U.S. Supreme Court has expanded protections to defendants in civil cases much as it expanded protections to criminal defendants in the 1960s. We are confident that few, if any, unreasonable results survive the review process.

The second critique is that the transaction costs (court administrative and attorneys’ fees) of the civil justice system are too high. We believe that the tort system is worth its transaction costs. Unlike a bare-bones no-fault system, the tort system marshals lawyers’ investigations, experts’ opinions, and jurors’ determinations to answer complex safety questions and set minimum standards for consumer protection. Within the category of “transaction costs” are attorneys uncovering the Ford/Firestone scandal; Erin Brockovich’s investigation of the poisonings in Hinkley, California; and the work that exposed tobacco company fraud in manufacturing and marketing cigarettes.

Nevertheless, both consumers and corporations agree that unnecessary transaction costs should be cut when possible. Defense lawyers have favored reduction of document discovery, and plaintiffs’ lawyers have favored limits on the length of depositions. But care must be taken to ensure that the “cost-cutting” label is not used to disguise measures that advantage one side. Just as defendants are skeptical of reducing the size of juries from twelve to six, consumers and patients are skeptical of measures such as mandatory arbitration.

The third critique of the tort system is that it awards too much compensation. It is with this argument that we fully and vehemently disagree. As we have noted earlier, there is overwhelming evidence that most injuries are not being compensated.

The medical community needs to say explicitly why it thinks a 6-to-1 disparity in injuries to claims is not favorable enough. Do they think it should be a 12-to-1 disparity? 20-to-1? What is their justification? The Health Care Liability Alliance has on its website a comparison of American tort expenditures to those in Japan and Denmark. Are doctors suggesting that Americans should mimic the conflict-aversion of Japanese culture or the stoicism of Scandinavian culture? Is there something wrong with us Americans? Is our individualism excessive? Debate is being driven by anecdotes, slogans, and hyperbole, without an acknowledgment or discussion of the values underlying the system.
We deplore the efforts to place arbitrary caps on so-called “non-economic damages.” This Orwellian term has been applied to damages for pain and suffering (for injuries resulting in paralysis, loss of limb, etc.), disfigurement, and loss of fertility in an effort to demean their importance. The tremendous amount of money spent on such things as pain relief medication, grief counseling, cosmetic surgery, and fertility treatments belies the absurd notion that such damages could be “non-economic.” To make matters worse, caps by definition apply only to the most catastrophically injured victims.

Every reputable economist says that paid damages need to be equal to injury costs in order to force an industry to exercise safety precautions. The conservative appointees to the President’s Council of Economic Advisors phrased it very well in their recent report on the tort system:

[A] patient purchasing a medical procedure, for example, may be unlikely to fully understand the complex risks, costs and benefits of that procedure relative to others...In such a case, the ability of the individual to pursue a liability lawsuit in the event of an improper treatment, for example, provides an additional incentive for the physician to follow good medical practice. Indeed, from a broad social perspective, this may be the least costly way to proceed – less costly than trying to educate every consumer fully. In a textbook example, recognition of the expected costs from the liability system causes the provider to undertake the extra effort or care that matches the customer’s desire to avoid the risk of harm. This process is what economists refer to as “internalizing externalities.” In other words, the liability system makes persons who injure others aware of their actions, and provides incentives for them to act appropriately.¹

Measures that reduce compensation will reduce patient safety. Reducing tort system expenditures does not reduce the cost of injuries but shifts them, and ultimately increases them. While it is unfortunate that doctors have had to cope with large spikes in liability premiums, the silver lining is the message that the tort system is sending about medical errors. Publicly, doctors are saying that the tort system is out of control and needs to be fixed. But privately, we are certain, doctors are saying that they need to get their house in order, and ramp up new patient safety systems and risk management efforts.

Analysis of the Medical Malpractice “Crisis” in Five States
A Climate of Crisis: Florida

Introduction

From 1996 to 1999, Florida hospitals reported nearly 20,000 preventable adverse medical incidents involving patients, but only 3,200 medical malpractice claims were filed against them. Yet, medical lobby contends Florida is experiencing a litigation “crisis.”

Governor Jeb Bush has appointed a Select Task Force on Healthcare Professional Liability Insurance to figure out how to stop doctors’ malpractice insurance rates from climbing. The task force will make a recommendation before March’s legislative session. But Florida already has numerous restrictions in place, including a “non-economic” damages cap of $350,000 when doctors admit liability.

Assumptions vs. realities

The so-called crisis is the result of the economic cycle and poor business decisions made by the insurance industry. It is not the result of a litigious society, or the product of frivolous lawsuits. Therefore, tort “reform” cannot possibly address current grievances.

- **The number of medical errors reported by Florida hospitals exceeds the number of medical malpractice claims filed each year by 6 to 1.** About two-thirds of malpractice claims arise during hospitalization. Reports prepared by Florida’s Agency for Health Care Administration have compared reports of adverse incidents in hospitals to the filing of new malpractice claims. From 1996 through 1999, Florida hospitals reported 19,885 incidents but only 3,177 medical malpractice claims.¹ This means that for every 6 adverse incidents in the hospital, only 1 malpractice claim is ever filed. This is similar to the groundbreaking Harvard Medical Practice study’s finding of only one claim made for every 7.6 hospital injuries.²

The costs of medical malpractice in Florida

The true impact of medical malpractice in Florida should be measured by the cost to consumers, not the premiums paid by doctors to their insurance companies. Consider these facts:

- Estimated preventable deaths annually in Florida due to medical errors: 2,499-5,566
- Estimated annual costs in Florida resulting from preventable medical errors: $965 million - $1.65 billion
- Cost of Florida doctors’ medical malpractice premiums paid in 2000: $505.5 million.³

Examples of some of Florida’s doctors who are “repeat offenders”

- Using the National Practitioner Data Bank, Public Citizen found records of 24 Florida physicians who have paid ten or more malpractice settlements since 1990.⁴ Amazingly, of those 24, only 12 have been disciplined by the Florida Board of Medicine. Because it was not doing its job, many people were needlessly injured and they and their families will suffer for their lifetimes as a result.
Physician Number 7540, licensed in Florida, settled or lost 32 medical malpractice suits involving failure to maintain infection control between 1971 and 1991. The damages incurred by this doctor’s patients totaled $1.36 million. Authorities in Florida have never disciplined this doctor.

Physician Number 98892 settled 18 malpractice lawsuits between 1991 and 1997 involving improper performance of surgery. The damages added up to some $2 million. This physician has never been disciplined.

Physician Number 27908 worked in New York State, where he lost one malpractice suit and settled nine others for a total of $3.7 million. Around 1991, Physician 27908 moved his practice to Florida, where he settled seven more malpractice suits for a total of $3.3 million. This doctor, with 17 malpractice lawsuits totaling $7 million, finally surrendered his New York medical license in 1999, 15 years after the first incident. He still has not been disciplined by Florida authorities.

Physician 69310 practiced medicine in Indiana, where he accumulated 11S lawsuits. Around 1996 he moved to Florida and settled 4 more, paying some $2 million in damages to injured patients. This physician has not been disciplined by either Indiana or Florida authorities.

Florida has exported as well as imported questionable doctors. Physician Number 8269 settled 14 malpractice lawsuits in Florida between 1982 and 1992. Florida never disciplined this doctor. He moved on to Maryland, where he settled another lawsuit for $695,000. He finally relinquished his Maryland license in 1999.

- Many of Florida’s most dangerous doctors continue to practice and the state watchdog is asleep on the job. Public Citizen’s study, Questionable Doctors in Florida, found that there are 1,555 physicians who have been disciplined by Florida’s state medical and osteopathic boards for incompetence, misprescribing drugs, sexual misconduct, criminal convictions, ethical lapses and other offenses. Many were not required to stop practicing, even temporarily. In fact, only 36 percent of Florida’s disciplinary actions in 2001 were serious – meaning license revocation, suspension, surrender or probation. When compared to the rest of the country, only two states were worse in that regard, Wisconsin (22 percent) and North Carolina (32 percent). Overall, Public Citizen ranks Florida 26th among the states in terms of the performance of its state medical board, which is charged with policing the medical profession.

Rates for other insurance products are rising along with medical malpractice premiums

- Florida’s Department of Insurance has approved 2001-2002 rate increases for medical malpractice insurers ranging from 6 percent to 40 percent, with the average being 26 percent. As these rates have increased due to economic and management factors, the insurance rates in other categories – automobile, healthcare, property/casualty, homeowner, commercial and workers’ compensation – have also risen significantly.
• Media reports indicate that rate increases are up for many types of insurance in the state. Types of insurance and rate increases in Florida during 2002 include: medical malpractice (26 percent); health insurance (20 to 28 percent); auto (10.6 percent); and homeowners (15.7 percent).[^7]

**Better alternatives**

Positive solutions include reducing claims by preventing medical errors and punishing bad doctors, and taking a closer look at insurance industry business practices.

• **Reduce medical errors**

  Surgery performed on the wrong part of the body, to the wrong patient, and performing the wrong procedure on a patient are all completely preventable and should never happen, according to a special alert reissued December 5, 2001 by the Joint Commission on Accreditation of Healthcare Organizations.[^8]

  Yet, during 2001 there were 79 such incidents in Florida:

  - 54 surgeries on the wrong part of the body
  - 16 wrong procedures performed
  - 9 surgeries performed on the wrong patient[^9]

• **Increase the number of nurses**

  Governor Bush recognized the severity of the nursing shortage when he signed the Nursing Shortage Solution Act (H.B. 519) in May of this year. This attempt to streamline the licensing procedure for out of state nurses and increase funding for nursing education is a positive step in the right direction, but more must be done.

  In October, the Florida Hospital Association (FHA) released its 2002 nurse vacancy survey of hospitals to gauge the shortage and determined the statewide vacancy rate for registered nurses stands at 12.5 percent. One in every eight nursing positions in Florida is vacant, amounting to an estimated 8,660 vacant RN positions in February 2002.[^10]

  Though Florida has the highest percentage of elderly in the country, it ranks 31st in the number of registered nurses per 100,000 population. It is a problem that is expected to get much worse. The Florida Hospital Association estimates that there will be a need for 34,000 more nurses by 2006, and 61,000 more nurses than will be available by 2020, an 18 percent vacancy rate.[^11]

A Climate of Crisis: Mississippi

Introduction

In Mississippi, changes in medical malpractice were lumped into a broad, pro-business agenda that sought to make it harder for consumers to collect damages from everyone—from manufacturers and small-business owners to auto dealers and doctors. A statewide coalition, representing 40 different associations, derisively mocked the Mississippi tort system as “jackpot justice” and put forth 42 different bills during the 2002 legislative session.

When the session ended in April, tort “reform” had gone 0-for-42. It was only when legislators were called back in September for an 83-day special session that changes were enacted to the Mississippi civil-justice system. The changes in malpractice law included placing caps on non-economic damages, holding physicians responsible only for their portions of non-economic damages, and requiring that lawsuits be filed in the county where the medical malpractice occurred.

The new laws took effect on Jan. 1, 2003. Although physicians had described the increase in malpractice rates in desperate terms, the president-elect of the Mississippi State Medical Association expressed only modest ambition for the new system. It may help to stabilize the market, Dr. George McGee told the Sun Herald newspaper in August. “It may not translate into premium reductions.”

Assumptions vs. realities

As it did in many states, the December 2001 decision by the St. Paul Companies, Inc. to cease offering liability coverage to doctors triggered the immediate talk of a malpractice insurance “crisis” in Mississippi. St. Paul was one of the top three malpractice insurance carriers in the state and covered 427 doctors.

Pointing to this development, the president of the Mississippi Medical Association reported that doctors statewide alleged that lawsuits were making it difficult for them to obtain insurance coverage. Lawsuits, however, had little to do with the departure of the St. Paul Companies from the marketplace. An analysis by the Wall Street Journal made these points about the decline in the medical liability insurance market:

- Some insurance carriers “rushed into malpractice coverage because an accounting practice widely used in the industry made the areas seem more profitable in the early 1990s than it really was. A decade of short-sighted price slashing led to industry losses of nearly $3 billion last year.”

- When malpractice claims increased in the 1980s, St. Paul and its competitors sharply raised rates. But, as the frequency and size of claims leveled off, St. Paul realized it had set too much money aside for malpractice payments. The company then released $1.1 billion from its reserves between 1992 and 1997, which dramatically boosted its bottom line.
• St. Paul’s apparent profitability attracted numerous, smaller carriers into the malpractice insurance market, which led to widespread, competitive price-cutting.

• By the end of the 1990s, the revenue from premiums decreased to the point that insurers no longer could cover malpractice claims. Some collapsed and others, like St. Paul, withdrew from the market. 

The centerpiece in the malpractice liability package passed by Mississippi’s Legislature was a $500,000 cap on non-economic damages – a limit scheduled to increase to $750,000 in 2011 and to $1 million after 2017. But an examination of malpractice awards and current malpractice insurance rate problems in Mississippi shows almost no direct linkage between the two.

In August 2002, the Sun Herald newspaper published an in-depth report on the malpractice insurance showdown, relying on data available from the Board of Medical Licensure, the state Medical Association and other sources. Its findings included:

• Although premiums had increased dramatically for some medical specialists, across the board, Mississippi’s malpractice rates increased about 15 percent during 2002 – not higher than many other states, including those with caps on awards.

• In 2001, Medical Assurance Co. of Mississippi had 397 lawsuits, but paid out on only 73, according to the company’s records. It paid out an average of $261,194 per claim – well below the state’s new cap.

• Since lawsuits reportedly began escalating in 1995, there has been only one mega-award against a medical provider in Mississippi – a $23 million award against a medical center where a baby was dropped at childbirth and suffered permanent brain damage.

Rates that are being requested and approved for other forms of insurance in Mississippi indicate that malpractice insurance is part of a broader trend of rising insurance costs.

• In January 2003, the Mississippi Insurance commissioner approved a 19.9 percent increase statewide for State Farm homeowner policy premiums – with a 25 percent hike approved for homeowners in the coastal regions. A month earlier, the insurance company had requested a 42.5 percent statewide increase.

• In September 2002, Aetna proposed rate increases of about 25 percent for one group of policyholders in Hinds County, Ms. A year earlier, Aetna had sought a 41 percent increase in premium rates.

The costs of medical malpractice in Mississippi

The true impact of medical malpractice in Mississippi should be measured by the cost to consumers, not the premiums paid by doctors to their insurance companies. Consider these facts:

  Estimated preventable deaths annually in Mississippi due to medical errors: 445-991
  Estimated annual costs in Mississippi resulting from preventable medical errors:
  $172-293 million
  Cost of Mississippi doctors’ medical malpractice premiums paid in 2000: $35.4 million.
A questionable accomplishment

- The public relations and advertising campaigns that pushed for changes in Mississippi’s malpractice laws made it clear that businesses and physicians placed a high priority on this accomplishment. What is not clear, however, is what other – if any – tangible results they achieved.

- Early last year, 474 Mississippi physicians published full-page newspaper ads in which they labeled the state “Litigation Central,” and melodramatically claimed, “Our legal climate has a disease no physician can cure. The cure is in the hands of the Mississippi Legislature.”

- In May 2002, the U.S. Chamber of Commerce joined in the criticism of Mississippi’s lack of tort-reform, claiming it had created a bad business climate. During this same time, studies were showing the state was scoring great successes in industrial recruitment and retention.

- When doctors took their malpractice pleas public, doctors from Gulfport Memorial Hospital bought newspaper ads to warn patients that they might be unable to remain in business without insurance coverage. Within weeks, however, all but one of the physicians had been able to replace their malpractice policies.

- While Mississippi still ranks nearly last among states in the number of doctors per capita, it has made dramatic gains since 1995. In fact, only four states have had faster increases in their number of physicians.

In the end, it appears Mississippi political and medical leaders pursued a central tactic: limiting the amount of money patients can collect after they have been injured by medical errors. This narrowly focused change, however, did nothing to address the central challenge of reducing liability payments by reducing medical errors.

A Climate of Crisis: Nevada

Introduction

Nevada began 2002 with political and medical leaders proclaiming a “malpractice crisis” in the state – especially in Southern Nevada, where Las Vegas is located. By October, an emergency session of the Legislature enacted several changes in Nevada’s tort laws, placing limits on the amount injured patients can receive for pain and suffering and creating a $50,000 cap on damages against hospitals and physicians who treat trauma patients. None of the changes, however, effectively addressed the need to reduce the rate at which patients are harmed by substandard medical care in Nevada.

Nevada ended 2002 with little good to show for the changes it had rushed into place. Malpractice premiums remained high, numerous physicians – especially those in high-risk specialties – were still threatening to leave the state, and a doctor-led referendum movement had pronounced Nevada’s tort reform efforts a failure.

Assumptions vs. realities

Doctors and politicians in Nevada adopted their crisis mentality shortly after the state’s leading provider of malpractice insurance, the St. Paul Companies, Inc. announced in December 2001 that it would no longer make liability coverage available to doctors. Health professionals and insurance industry representatives were quick to assign blame for the problem, as the Las Vegas Review-Journal reported, claiming that “insurance rates are rising because there are too many frivolous medical malpractice lawsuits and there is no cap on the amount of money juries can award.”

In fact, the decision by the St. Paul Companies had more to do with its reckless cash flow policies than it did with jury awards. A Wall Street Journal analysis of the decline in the medical liability insurance market made these points:

- Some insurance carriers “rushed into malpractice coverage because an accounting practice widely used in the industry made the areas seem more profitable in the early 1990s than it really was. A decade of short-sighted price slashing led to industry losses of nearly $3 billion last year.”

- When malpractice claims increased in the 1980s, St. Paul and its competitors sharply raised rates. But, as the frequency and size of claims leveled off, St. Paul realized it had set too much money aside for malpractice payments. The company then released $1.1 billion from its reserves between 1992 and 1997, which dramatically boosted its bottom line.

- St. Paul’s apparent profitability attracted numerous, smaller carriers into the malpractice insurance market, which led to widespread, competitive price-cutting.

- By the end of the 1990s, the revenue from premiums decreased to the point that insurers no longer could cover malpractice claims. Some collapsed and others, like St. Paul, withdrew from the market.
Within six weeks of the announcement by the St. Paul Companies, Nevada Gov. Kenny Guinn, met behind closed doors with a small group of physicians and reached the swift conclusion that the state should impose caps on malpractice awards.³

But a detailed look at malpractice insurance problems in Nevada shows that claims by patients were singled out inappropriately.

- From 1997 through 2001, the mean number of payments made annually to cover malpractice claims in Nevada was 89 – exactly the number reported for 2001. In other words, state declared its crisis following a year in which the annual number of malpractice payments was not extreme. (In fact, there was a decline in this annual number between 2000 and 2001.)⁴

- In Clark County, which includes the fast-growing Las Vegas area, there had been no extreme escalation of malpractice lawsuits filed. According to District Court records, 133 suits were filed in 1998, 148 were filed in 199 and 158 were filed in 2000. Of the cases filed in 2000, only 17 went to a jury trial and the remainder were dismissed or settled out of court.⁵

- Although physicians in Las Vegas experienced the same kinds of rate increases as doctors in many metropolitan areas, they were paying substantially less than the highest rates within their specialties⁶:

**Sample of annual 2002 premiums paid by general surgeons:**
- Miami (Dade County), Fla. - $174,268
- Detroit, Mich. - $107,139
- Las Vegas (Clark County), Nev. - $85,056
- Chicago (Cook County), Ill. - $75,630
- Cleveland, Ohio - $74,554
- New York (Nassau/Suffolk counties), N.Y. - $65,870

**Sample of annual premiums paid by obstetricians-gynecologists:**
- Miami (Dade County), Fla. - $210,576
- Cleveland, Ohio - $152,496
- Las Vegas (Clark County), Nev. - $141,760
- Detroit, Mich. - $140,917
- New York (Nassau/Suffolk counties), N.Y. - $115,431
- Chicago (Cook County), Ill. - $110,091
- Brownsville, Laredo, El Paso (Rio Grande Valley), Texas - $97,830

**The costs of medical malpractice in Nevada**

The true impact of medical malpractice in Nevada should be measured by the cost to consumers, not the premiums paid by doctors to their insurance companies. Consider these facts:

- Estimated preventable deaths annually in Nevada due to medical errors: 312-696
- Estimated annual costs in Nevada resulting from preventable medical errors: $121,206 million
- Cost of Nevada doctors’ medical malpractice premiums paid in 2000: $50.8 million.⁷
• Medical negligence was not the only form of insurance for which rates have been rising dramatically in Nevada. Sierra Health Service, which has 55 percent of the statewide market for health insurance, forecasts double-digit increases for most of its client groups this year – and increases as high as 20 percent for some.8

Pressure for a misdirected solution

Physicians in Nevada took drastic, overt steps to pressure the state’s political leaders to respond to the malpractice insurance crisis by emphasizing caps on jury awards.

• Southern Nevada’s only trauma center shut down for 10 days, July 3 through July 13, when dozens of doctors resigned over liability concerns. These physicians objected when politicians described them as “striking workers,” but most had not stopped working at other hospitals during the trauma center’s closure.9

• Threats by physicians to close their practices or leave the state in reaction to insurance costs are particularly potent in Nevada, which gained population at a rate of 66 percent between 1990 and 2000, but ranks only 46th in the nation for its number of doctors per 100,000 population.10

• In April, the executive director of the Nevada State Medical Association told a legislative committee that 100 physicians were poised to leave the state in coming months in reaction to increasing insurance premiums.11

• Doctors sponsored a $1 million campaign of newspaper ads encouraging public support for tort reform.12

• In a related matter, the District Attorney’s office opened an investigation into possible legal violations associated with a paid political advertisement supporting tort “reform,” published by the top administrator at the publicly funded University Medical Center in Las Vegas.13

Tort “reform” gets a failing grade

The Nevada Legislature met in a four-day special session at the end of July and enacted changes in its tort system that14:

• Placed a $350,000 cap on non-economic damages in most cases.

• Placed a $50,000 limit on damages for hospitals and physicians treating trauma patients.

• Holds doctors financially liable only for the damages for which they are responsible.

• Allows judgments to be paid over time.

By most measurements, however, these responses to Nevada’s malpractice insurance problems have been ineffective.
• One month after the new medical liability laws took effect, at least 20 Las Vegas obstetricians still were making plans to leave the state or abandon their practices. Doctors complained that tort reform had not succeeded in reducing their malpractice premiums.15

• The new medical liability laws will not halt the exodus of physicians from the state or ensure consumer’s access to medical care, according to a report by a legislative analyst hired by a physician-led group, “Keep Our Doctors in Nevada.” The organization is circulating initiative petitions to dump the recent changes and try again.16

• In the process of proposing solutions to the malpractice problems, Gov. Kenny Guinn rejected suggestions that Nevada make it easier to weed out bad doctors. The governor and lawmakers did not support efforts to allow consumers to see complaints filed against doctors or to learn of disciplinary actions taken by hospitals against staff physicians.17

Missed opportunity

The decision to allow only voluntary and confidential reporting of medical errors and complaints against doctors reflects Nevada’s determination to reduce payments to injured patients – but not to reduce the likelihood that patients will be harmed by substandard care.

• In the words of Dr. Bernard Feldman, member of a legislative subcommittee established to study a system for reporting medical errors, “There is no evidence this kind of voluntary system will reduce medical errors.” He also questioned whether hospitals would voluntarily comply with a request to report medical errors to a public registry.18

• An opportunity exists in Nevada to reduce medical liability payments through better policing of the state’s worst doctors. As a case in point, one of Nevada’s worst doctors surrendered his license and moved to California at the end of June 2001. Orthopedic surgeon Francis G. D’Ambrosio was sued five times during 2001 – a rate that a local newspaper called a “record” for Clark County. In two of the cases, he was accused of turning older patients into paraplegics.19

CBSNews reported that by the time D’Ambrosio arrived in California, he had amassed a record of 39 lawsuits, 21 settlements and “was already building his reputation as the most sued surgeon in Nevada.” And to make matters worse, “Nevada’s medical board didn’t post D’Ambrosio’s record until June of this year [2002] after its investigation was done. More than a year after he’d surrendered his Nevada license.”20

A Climate of Crisis: Pennsylvania

Introduction:

Doctors loudly demanded that Pennsylvania enact malpractice tort “reform” during 2002, claiming that the cost of liability insurance threatened to drive them out of state or out of business. The Legislature responded by mid-March with a set of changes that limit the jurisdictions in which injured patients can file suits, allow malpractice payments to be paid over time, and prohibit patients from seeking damages already paid by a health insurer. This exercise, however, did not curtail the rising premiums charged by malpractice insurers, and it did not contain the fix-all advocated by business leaders, physicians, and insurance companies – a cap on the amount that injured patients can be awarded for pain and suffering.

In the final days of 2002, Governor-elect Edward Rendell was able to avert a walkout by Pennsylvania physicians only by pledging to support an emergency bailout that will allow him to significantly cut doctors’ payments to a state insurance fund by imposing a new tax on health insurance.¹ Amid the recent talk of insurance premiums and possible physician walkouts, little has been said about the need to reduce malpractice liability by reducing medical errors and decreasing the rate at which patients are harmed.

Assumptions vs. realities

Concerns about a malpractice insurance “crisis” surfaced in 2001 after two insurers left the Pennsylvania market. Phico Insurance Co. was the third-largest malpractice insurer in the state, and the St. Paul Companies, Inc. was the seventh largest. Together they carried about 18 percent of the state’s physicians.

In each case, the departure of the insurance company from the market had much less to do with malpractice award payments than with the mismanagement of the company itself.

• Phico had been placed under the supervision of insurance regulators and was later sued by the state’s Insurance Department. The lawsuit alleged that Phico directors ignored signs of financial trouble at the company and pressured the board to pay dividends at a time when the insurer's surplus “was declining drastically and significant strengthening of loss reserves was required.”²

And a Wall Street Journal analysis of the decline in the medical liability insurance market made these points about The St. Paul Companies:

• Some insurance carriers “rushed into malpractice coverage because an accounting practice widely used in the industry made the areas seem more profitable in the early 1990s than it really was. A decade of short-sighted price slashing led to industry losses of nearly $3 billion last year.”

¹

²
• When malpractice claims increased in the 1980s, St. Paul and its competitors sharply raised rates. But, as the frequency and size of claims leveled off, St. Paul realized it had set too much money aside for malpractice payments. The company then released $1.1 billion from its reserves between 1992 and 1997, which dramatically boosted its bottom line.

• St. Paul’s apparent profitability attracted numerous, smaller carriers into the malpractice insurance market, which led to widespread, competitive price-cutting.

• By the end of the 1990s, the revenue from premiums decreased to the point that insurers no longer could cover malpractice claims. Some collapsed and others, like St. Paul, withdrew from the market. ³

Business leaders, physicians and insurance companies in Pennsylvania lobbied for caps on the amounts that injured patients can recover for pain and suffering. A state House-approved measure contained a $250,000 cap on malpractice awards, which was deleted in the state Senate.

Because the proposed caps collided with Pennsylvania’s constitution, which prohibits the general assembly from limiting damages paid for personal injuries, advocates for the $250,000 cap sought a provision that would allow doctors to request that patients sign “voluntary” waivers agreeing not to seek awards in excess of $250,000 before receiving treatment. ⁴

When the tort reform package finally was adopted, a spokesman for the Pennsylvania Medical Society said, “This is another step toward reform, but it is certainly not the end. Ultimately, we want a cap on pain and suffering.” ⁵

An examination of malpractice awards in Pennsylvania indicate, however, that neither large damage awards – nor the lack of “sign or die” waivers – can be blamed for the state’s malpractice problems.

• Malpractice award payments in Pennsylvania have shown an average jump that was smaller than the average increase in average payments recorded nationwide over the past decade. (The mean payment in Pennsylvania during 2000 was 15.5 percent greater than the state’s cumulative mean since 1990. The national mean for 2000 was nearly 19 percent higher than the cumulative mean for payments made since 1990.) ⁶

**The costs of medical malpractice in Pennsylvania**

The true impact of medical malpractice in Pennsylvania should be measured by the cost to consumers, not the premiums paid by doctors to their insurance companies. Consider these facts:

- Estimated preventable deaths annually in Pennsylvania due to medical errors: 1,920-4,277
- Estimated annual costs in Pennsylvania resulting from preventable medical errors:
  - $742 million - $1.3 billion
- Cost of Pennsylvania doctors’ medical malpractice premiums paid in 2000: $325.8 million. ⁷
**False sense of urgency**

To make certain their message about a malpractice “crisis” got through to the public and to political leaders in Pennsylvania during 2002, physicians lobbied openly, ran advertising campaigns – and frequently raised the specter of doctors closing their offices or leaving the state.

- As one journalist commented regarding radio advertisements broadcast in favor of tort reform, “You’d think the day was fast approaching when no doctor would be left in Pennsylvania to care for your sick mother.”

- In fact, the emergency bailout plan put forward by Gov.-elect Rendell during the last week of December purportedly “stopped a mass exodus of physicians across the state with a promise of reform for medical liability.”

- The trauma center at Abington Memorial Hospital in the Philadelphia area was shutdown for nearly two weeks when surgeons rebelled against the costs of liability insurance. And physicians threatened to quit work at trauma facilities in Scranton, Pa., starting on Jan. 1, 2003.

The idea that Pennsylvania consumers are on the brink of losing their access to physicians is simply not borne out by statistics.

- Between 1990 and 2000, a period during which the state’s population grew only 3.4 percent, the number of doctors in Pennsylvania increased by 13.5 percent.

- The head of the Pennsylvania Medical Professional Liability Catastrophe Loss Fund, John H. Reed, reported that there was no evidence of “any major departure of physicians from the state” and that Pennsylvania had “more doctors [in 2001] than we did five or 10 years ago.”

In addition, reporter Ann Wlazelek of the *Morning Call* newspaper in Allentown, Pa., published an investigative report in March 2002 that claimed, “The advertising blitz used by doctors and hospitals to win $400 million in state concessions on malpractice insurance by claiming large numbers of physicians are fleeing Pennsylvania is not supported by fact.” Wlazelek other published findings included:

- In 2000, Pennsylvania ranked ninth best in the nation for its concentration of physicians, with 318 doctors for every 100,000 residents.

- The secretary of the Pennsylvania Medical Society circulated an unreliable claim that the state was about to lose 80 doctors who were preparing to leave or to modify their practices because of insurance rates. (The number did not reflect the fact that some doctors were quitting or leaving for reasons other than insurance. And it did not reflect the number of doctors who had moved into Pennsylvania.)

- Hospitals across the region confirmed that they had been “hit hard financially,” but none of them have had to “eliminate services or close units.”
• Although Pennsylvania doctors – some specialists in particular – had encountered larger-than-normal insurance rate increases, some of their previous rates had been the result of “low-ball” pricing that insurers had used to increase volume.

**Tort reform misses the mark**

When Pennsylvania adopted its legislative package in March 2002, doctors and their representatives joined with legislators in heralding the changes. “Without question,” said Howard Richter, president of the Pennsylvania Medical Society, “the medical liability reforms contained in this legislation will place Pennsylvania in the forefront in addressing what is clearly becoming a national crisis for physicians and their patients.”

The very fact that Pennsylvania finished 2002 facing threats of doctor walkouts, potential hospital closures, and an emergency bailout plan makes it obvious that the changes did not meet expectations.

Lost in the shuffle – and amid the disappointing results – were provisions in the malpractice liability law creating a “patient safety authority to examine medical errors and recommend improvements” and requiring that hospitals and doctors “notify patients in writing about serious mistakes.” Critics of the law said this set of requirements “falls short of the public disclosure needed to curb the rise of serious medical errors.”

Pennsylvania is among the bottom third of U.S. states when its diligence in taking disciplinary actions is measured. Its rate of 2.18 serious actions per 1,000 doctors earns its a ranking of 36th out of the 50 states and the District of Columbia.

A Climate of Crisis: West Virginia

Medical malpractice premiums are skyrocketing, and doctors are on strike. The insurance industry would have the public believe that the current situation is the result of high jury awards and frivolous lawsuits. The insurers don’t want to admit they are manipulating rates to compensate for the reduction in profits from a poor investment market and thus look for a scapegoat, and have thus created the current “crisis.” Inevitably they blame the tort system because doctors (as well as insurers) hate to be sued. Targeting a common enemy not only stops the doctors from revolting against insurers. It also could help to close the courthouse door to pesky injured patients and their families.

Assumptions vs. realities

Medical Assurance, previously the largest medical malpractice underwriter in West Virginia, enlisted the help of the West Virginia Medical Association and doctors. Through a secret agreement Medical Assurance paid the Medical Association $115,000 per year since 1995, for an estimated $690,000. In exchange, the Association was to lobby legislators on the company’s behalf. As part of the contract, Medical Assurance offered doctors a reason to lobby as well – a share in profits and breaks in premiums – provided they bought their policies from Medical Assurance.

Medical Assurance was able to secretly push its own agenda by providing the media with its own facts, figures, and conclusion as to the cause of the premium crisis - “meritless” malpractice lawsuits. The West Virginia Medical Association echoed these talking points, and doctors repeated these points in opinion articles for more than a year when the secret contract was unearthed. The public was fed a manufactured list of facts that served to further the top insurance company in West Virginia. A majority of Medical Assurance’s talking points have been shown to be false.

Consider the following facts:

• Most claims are not frivolous. More than two-thirds of West Virginia medical malpractice cases end with a monetary settlement or damage award against the doctor.

• Medical malpractice payments in West Virginia are much lower than national averages and continue to decrease. Between 1993 and 2000, only 63 settlements and verdicts topped $1 million, about 4 percent of the 1,523 cases that were resolved in the plaintiff’s favor. The median settlement was less than $100,000, while the median verdict was $343,323.

• Rate increases are up for many types of insurance in West Virginia. In 2002, the Department of Insurance approved increases ranging from 10 to 18 percent for healthcare, 5.8 to 27.50 percent for homeowners, 6 to 13.5 percent for auto, and 4.7 to 26.40 percent for medical malpractice insurance.

• A few bad doctors are responsible for many of the malpractice claims.
Dr. Stuart Henry Fox has had at least ten claims filed against him for medical malpractice. He paid $2.7 million to settle eight claims, was ordered to pay $177,578 by a 1999 jury in the ninth claim, and was cleared by a jury for the tenth claim. At least three of these claims alleged malpractice resulting in death.\textsuperscript{7}

Dr. Oscar Solidum Irisari has paid $5.4 to settle 12 malpractice claims since 1983. Allegations include failing to diagnose breast cancer in a 32-year-old woman, and brain damage suffered by a child Irisari delivered in 1993.\textsuperscript{8}

The costs of medical malpractice in West Virginia

The true impact of medical malpractice in West Virginia should be measured by the cost to consumers, not the premiums paid by doctors to their insurance companies. Consider these facts:

- Estimated preventable deaths annually in West Virginia due to medical errors: 283-630
- Estimated annual costs in West Virginia resulting from preventable medical errors: $109-186 million
- Cost of West Virginia doctors’ medical malpractice premiums paid in 2000: $62.7 million.\textsuperscript{9}

Pressure for a misdirected solution

The current situation was created by the insurance industry’s poor business practices, and the doctors themselves who continuously commit malpractice upon their patients. To limit the ability of the injured to recover would be a travesty.

- **Repeat Offenders - The Current Strike:** Eighteen doctors recently staged a walk-out at Wheeling Hospital in Wheeling, West Virginia, claiming that their rates were too high. Nine of those on Wheeling Hospital's strike list have cost their previous insurers at least $6.3 million in malpractice claims, including the following:\textsuperscript{10}

  - **Dr. Howard L. Shackleford** agreed to pay $2 million to a patient who needed a liver transplant after a surgical clip was left on an artery in a 1997 operation. Shackleford has settled three other malpractice cases for a total of $500,000.

  - **Dr. Robert J. Zaleski** settled four claims for a total of $950,000 between 1993 and 1998. One alleged he operated on the wrong knee. Three other claims against Zaleski were dismissed during that time.

  - **Dr. Robert L. Cross** has had at least five claims filed against him since 1990. A jury ordered him to pay $250,000 in a 1997 case, while he settled a second case for $250,000 in 1998.

The medical malpractice insurance “crisis” in West Virginia is the result of the insurance cycle and improper business practices by the insurance industry.

- According to the Office of the West Virginia Insurance Commission, “The insurance industry is cyclical and necessarily competitive. We have witnessed these cycles in the
Medical Malpractice line in the mid-‘70’s, the mid-80’s and the present situation. This particular cycle is, perhaps, worse than previous cycles as it was delayed by a booming economy in the ‘90’s and is now experiencing not just a shortfall in rates due to competition, but a subdued economy, lower interest rates and investment yields, the withdrawal of a major medical malpractice writer and a strong hardening of the reinsurance market. Rates will, at some point, reach an acceptable level to insurers and capital will once again flow into the Medical Malpractice market.”11

- Medical Assurance has spent as much as 88 percent of its earned premiums on defense costs (not including amounts eventually paid to successful plaintiffs). By refusing to settle cases, Medical Assurance has been driving up defense costs.12

  Dr. Evangeline C. Pizarro alleges Medical Assurance ruined her practice and threatened her with bankruptcy by refusing to negotiate her malpractice claim in good faith. She was willing to settle for $300,000, well within her policy limits with Medical Assurance, but Medical Assurance instead forced the case to trial, where a jury returned a $7.5 million award against her, her lawsuit stated.13

An increase in malpractice insurance premiums is NOT driving doctors from West Virginia.

- The number of doctors in West Virginia has grown at a rate 20 times greater than the population. About 500 more doctors were practicing in 2000 as compared to 1990. The number of doctors in most specialties has remained constant or increased.14

- Data from a report by the West Virginia Higher Education Policy Commission showed that the percentage of West Virginia medical school graduates who choose to stay and practice in West Virginia has stayed stable, around 38 or 39 percent. For each year since 1996, the West Virginia Higher Education Policy Commission checked up on six years’ worth of West Virginia medical school graduates who finished their residencies. For example, in 2002, they checked up on people who graduated from medical school between 1992 and 1997. The 2002 survey showed a higher retention percentage (39 percent) than the 1997 survey (36 percent), before the malpractice crisis was even an issue.15

- Wheeling Hospital blames the rise in insurance rates for the loss of certain doctors. Should the Hospital really have kept them? Wheeling Hospital has lost three of its neurosurgeons in the past year, but two of those doctors had a total of 19 lawsuits filed against them for malpractice. Eighteen of the lawsuits were settled out of court, with the insurance companies paying damages. The third neurosurgeon also left after also being sued. That neurosurgeon admitted to drilling into the wrong side of a patient’s head, possibly causing permanent scarring. That neurosurgeon also lost a jury trial for botching a surgery and causing cerebral aneurysms and cardiac arrest.
1 (The Charleston Gazette obtained a copy of the secret contract after it was listed as an exhibit in a filing from Medical Assurance to the SEC.) Lawrence Messina, “The Price of Malpractice; W. Va.’s medical malpractice debate: medical Assoc., insurance firm makes secret deal, Medical Assurance has paid $690,000 for lobbying efforts.” Charleston Gazette, Monday, February 26, 2001.

3 A study by Charleston Gazette reporters Lawrence Messina and Martha Leonard analyzed every medical malpractice claim reported to the West Virginia Board of Medicine since 1993. The study, which looked at nearly 2,300 claims filed with the Board as mandated by law, showed all of Medical Assurance’s talking points, which have been the subject of countless stories in the media, to be false. See: Lawrence Messina, “The Price of Practice; W.Va.’s medical malpractice debate: Malpractice claims have decreased. Study’s findings run counter to Medical Association allegations.” The Charleston Gazette, Sunday, February 25, 2001.
